Definition of a Disaster

A disaster is a catastrophic event that causes a massive outage affecting an entire building or site.

- A disaster can be anything from a natural disaster, such as
 - An earthquake, to the more common problem of stray backhoes cutting your cables by accident.
- A disaster is anything that has a significant impact on your company's ability to do business.

What is Disaster Recovery (DR)?

- Planning how to respond to disasters.
- Preparing systems for quick recovery.
- Ensuring business continuity.

Why Disaster Recovery is Important?

- Prevents business shutdown.
- Reduces financial loss.
- Protects data.

Disaster Preparation

- Backup systems.
- Off-site storage.
- Emergency team roles.
- Regular practice (drills)

Types of Disasters

- **Natural:**

- earthquake
- flood

- **Technical:**

- Hardware failure
- Software failures

- **Human:**

- errors
- hacking

Risk Analysis

The first step in building a disaster-recovery plan is to perform a risk analysis.

- Risk analysis involves determining what disasters the company is at risk of experiencing and what the chances are of those disasters occurring.
- The analyst determines the likely cost to the company if a disaster of each type occurred.
- The company then uses this information to decide approximately how much money is reasonable to spend on trying to mitigate the effects of each type of disaster.

Risk Analysis

The approximate budget for risk mitigation

=

(Probable cost of disaster – Probable cost after mitigation)

Risk of disaster

Damage Limitation

- Damage limitation is about reducing the cost of disasters.
 - Some damage limitation can come at little or no cost to the company through advanced planning and good processes.
 - Using lightning rods in the construction of buildings in an area that is prone to lightning storms is also a cheap way of limiting damage.
 - Most damage limitation involves additional costs to the company and is subject to the cost/benefit analysis that is performed by the risk analysts:

Data Integrity

- Data integrity means ensuring that data is not altered by external sources.
 - Data can be corrupted maliciously by viruses or individuals. It can also be ruptured inadvertently by individuals, bugs in programs, and undetected hardware malfunctions.
