Lecture Note 07 – URL & Domain Name

K T Dananjali
Lecturer (Unconfirmed)
Department of Computing and Information Systems
Faculty of Computing

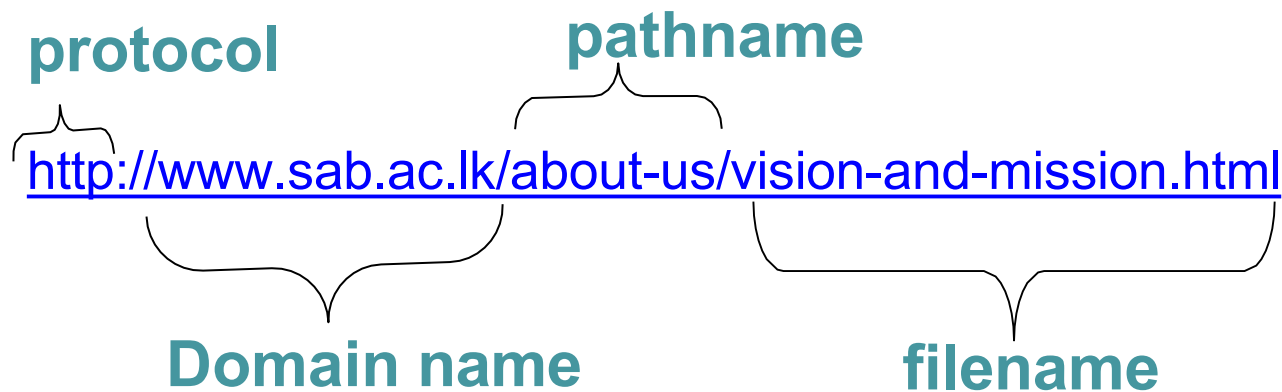

What is a URL?

- Unique address for a Web page
- URL is a four-part addressing scheme that tells the Web browser:
 - What transfer protocol to use for transporting the file
 - The domain name of the computer on which the file resides
 - The pathname of the folder or directory on the computer on which the file resides
 - The name of the file

Uniform Resource Locator (URL)

- The IP address and the domain name each identify a particular computer on the Internet.
- However, they do not indicate where a Web page's HTML document resides on that computer.
- To identify a Web pages exact location, We need Uniform Resource Locator (URL).

Structure of a Uniform Resource Locator

HTTP => Hypertext Transfer Protocol

Activity

- Distinguish between URL and URI

URL (Uniform Resource Locator)

The complete web address used to access a webpage or resource.

Example: <https://www.example.com/page>

Domain Name

The easy-to-read name of a website.

Example: [example.com](https://www.example.com)

Domain Name Addressing

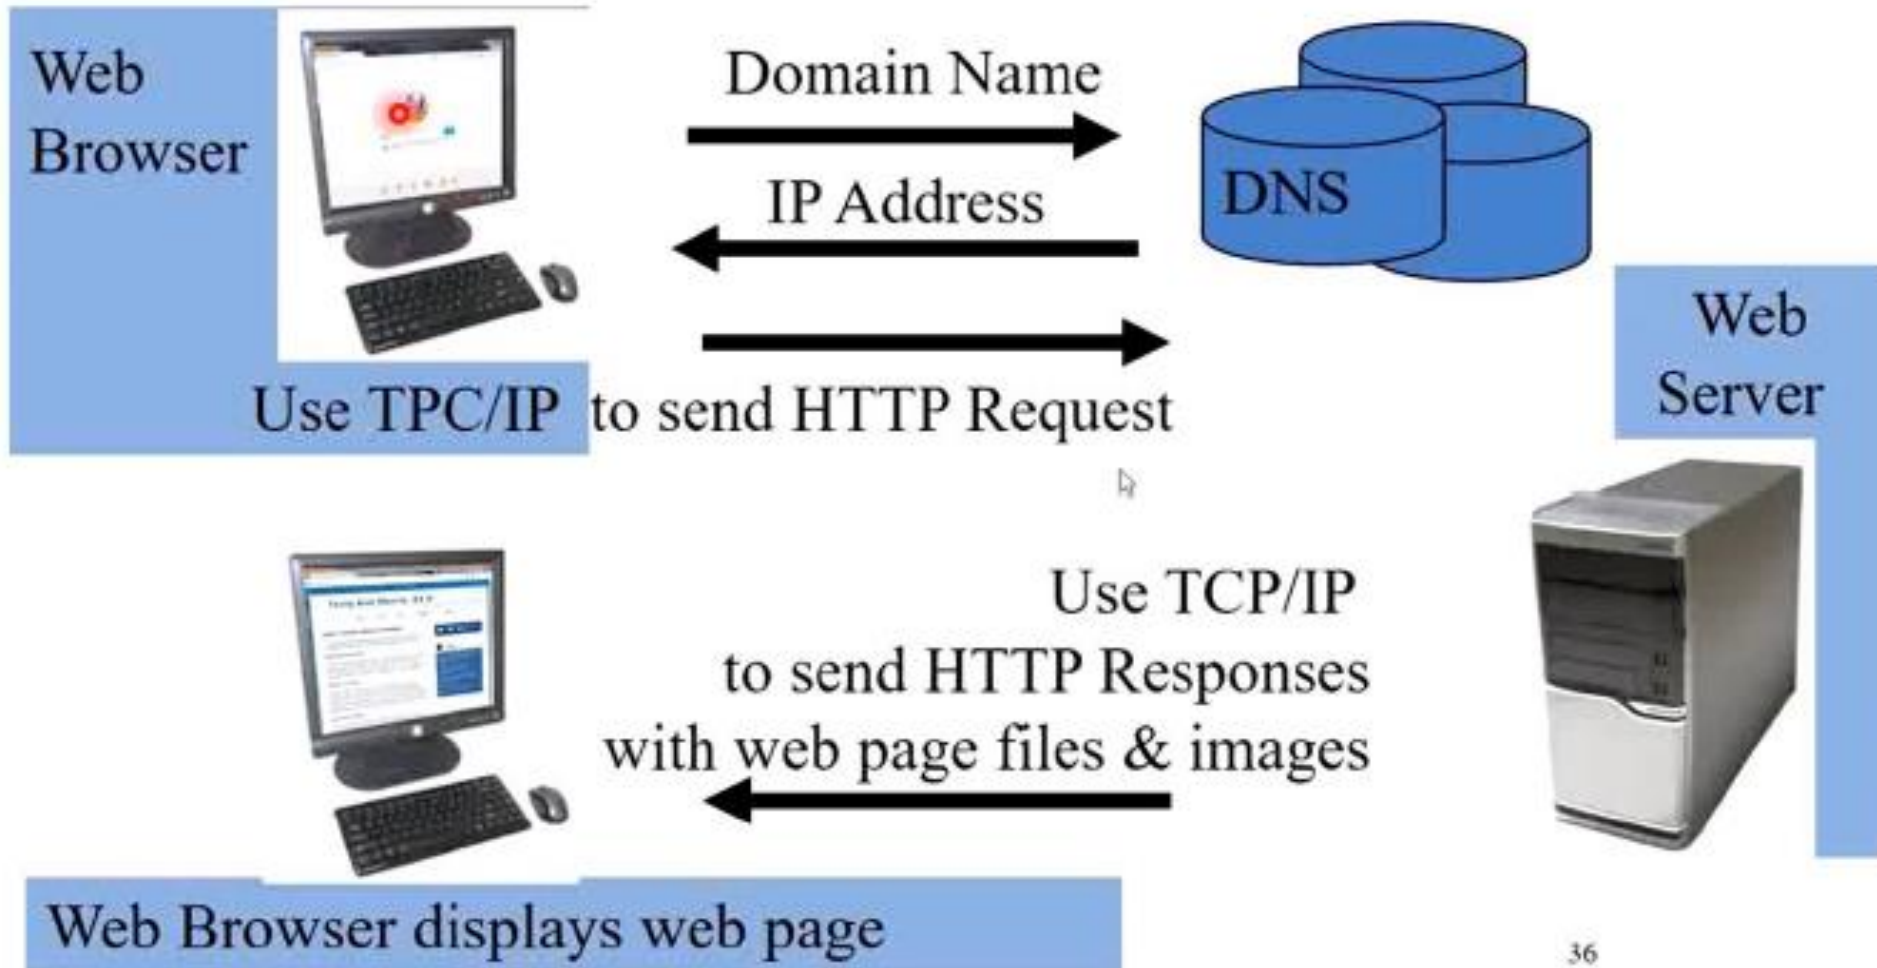

- Most web browsers do not use the IP address to locate Web sites and individual pages.
- They use domain name addressing.

- A **domain name** is a unique name associated with a specific IP address.

Domain Name System

- The Domain Name System (DNS) associates Domain Names with IP addresses.

TLD

Top-Level Domain Name

- A top-level domain (TLD) identifies the right-most part of the domain name.
- Examples of generic TLDs:
.com, .org, .net, .mil, .gov, .edu, .int, .aero, .asia, .cat, .jobs,
.name, .biz, .mobi, .museum, .info, .coop, .post, .pro, .tel, .travel

County Code TLDs

- Two character codes originally intended to indicate the geographical location (country) of the web site.
- In practice, it is fairly easy to obtain a domain name with a country code TLD that is not local to the registrant.

- Examples:

.lk, .au, .jp, .uk

More information: <http://www.iana.org/cctld/cctld-whois.htm>

Common Domain Extensions

Category	Examples	Typical Purpose
gTLD (Generic)	.com, .net, .org	General commercial or non-profit usage.
ccTLD (Country)	.uk, .ca, .de	Entity localized to a specific territory.
sTLD (Sponsored)	.edu, .gov, .mil	Restricted to verified organizations.
New gTLD	.tech, .shop, .art	Specific niches and brand expressions.

Domain vs Subdomain

Primary Domain

example.com

The primary digital storefront that represents the brand's root identity. Used to secure main corporate websites, core marketing platforms, and default operations.

Sub Domain

support.example.com

A distinct sub-identity structure added to categorize specialized services, regional apps, internal developer portals, or customer documentation centers, separately.
